

split_blocks=52 Resource Derivation

threads: $\text{floor}(1536/256)=6$ shared memory: $\text{floor}(102400/(1024+16640))=5$ registers: $\text{floor}(65536/(128 \times 256))=2$

Register limit dominates: 26 SM x 2 blocks/SM = 52 blocks. Fixed formula-derived setting, not automatic profiling.
